
[Brazil: Open Letter Against Tree Monocultures](#)

Disponible uniquement en anglais, [espagnol](#) et [portugais](#)

A threat spreads across our territories. Under the misleading name of “reforestation”, which sounds quite nice, huge plantations of exotic – and even genetically engineered – trees have been set up in Brazil by transnational corporations. True “green deserts” lead to the extinction of countless species of our fauna and flora and changed the fundamental characteristics of our incredible natural and cultural landscapes, with clear social and environmental impacts, threatening the traditional ways of life of peoples and communities.

As the first country in Latin America to deregulate a genetically engineered tree (a eucalyptus species) and with a favorable political environment, Brazil has become a reference for transnational companies to carry out their projects. Precisely for this reason, the World Congress of IUFRO – International Union of Forest Research Organizations – will be held in Brazil, between September 29th and October 5th, in Curitiba, Paraná. We reject this corporate event, where false solutions and new ways to increase corporate profits will be discussed, at the expense of the commons.
